SAFETY CONSIDERATIONS

Installing, starting up, and servicing air-conditioning equipment can be hazardous due to system pressures, electrical components, and equipment location (roofs, elevated structures, etc.).

Only trained, qualified installers and service mechanics should install, start-up, and service this equipment.

Untrained personnel can perform basic maintenance functions such as cleaning coils. All other operations should be performed by trained service personnel.

When working on the equipment, observe precautions in the literature and on tags, stickers, and labels attached to the equipment.

Follow all safety codes. Wear safety glasses and work gloves. Keep quenching cloth and fire extinguisher nearby when brazing. Use care in handling, rigging, and setting bulky equipment.

Read this manual thoroughly and follow all warnings or cautions included in literature and attached to the unit. Consult local building codes and National Electrical Code (NEC) for special requirements. Recognize safety information.

This is the safety–alert symbol \triangle . When you see this symbol on the unit and in instructions or manuals, be alert to the potential for personal injury. Understand these signal words: **DANGER**, **WARNING**, and **CAUTION**.

These words are used with the safety-alert symbol. **DANGER** identifies the most serious hazards which **will** result in severe personal injury or death. **WARNING** signifies hazards which **could** result in personal injury or death. **CAUTION** is used to identify unsafe practices which **may** result in minor personal injury or product and property damage. **NOTE** is used to highlight suggestions which **will** result in enhanced installation, reliability, or operation.

WARNING

ELECTRICAL SHOCK HAZARD

Failure to follow this warning could result in personal injury or death.

Before installing, modifying, or servicing system, main electrical disconnect switch must be in the OFF position. There may be more than 1 disconnect switch. Lock out and tag switch with a suitable warning label.

WARNING

EXPLOSION HAZARD

Failure to follow this warning could result in death, serious personal injury, and/or property damage.

Never use air or gases containing oxygen for leak testing or operating refrigerant compressors. Pressurized mixtures of air or gases containing oxygen can lead to an explosion.

A

CAUTION

EQUIPMENT DAMAGE HAZARD

Failure to follow this caution may result in equipment damage or improper operation.

Do not bury more than 36 in. (914 mm) of refrigerant pipe in the ground. If any section of pipe is buried, there must be a 6 in. (152 mm) vertical rise to the valve connections on the outdoor units. If more than the recommended length is buried, refrigerant may migrate to the cooler buried section during extended periods of system shutdown. This causes refrigerant slugging and could possibly damage the compressor at start—up.

INTRODUCTION

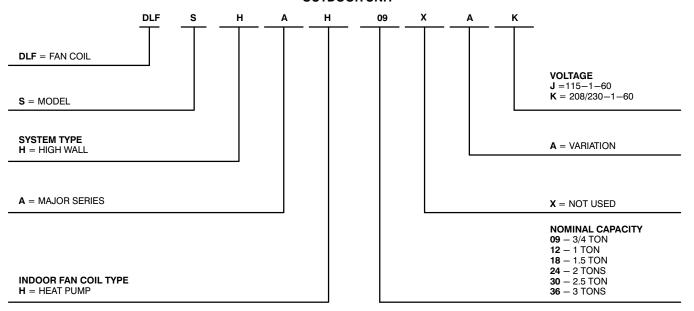

This service manual provides the necessary information to service, repair, and maintain the indoor units. Section 2 of this manual has an appendix with data required to perform troubleshooting. Use the Table of Contents to locate a desired topic.

LEGEND

FLA - Full Load Amps

WIRING

All wires must be sized per NEC (National Electrical Code) or CEC (Canadian Electrical Code) and local codes. Use Electrical Data table MCA (minimum circuit amps) and MOCP (maximum over current protection) to correctly size the wires and the disconnect fuse or breakers respectively.

Recommended Connection Method for Power and Communication Wiring:

The main power is supplied to the outdoor unit. The field supplied 14/3 stranded wire with ground with a 600 volt insulation rating, power/communication wiring from the outdoor unit to indoor unit consists of four (4) wires and provides the power for the indoor unit. Two wires are line voltage AC power, one is communication wiring (S) and the other is a ground wire. Wiring between indoor and outdoor unit is polarity sensitive. The use of BX wire is NOT recommended.

If installed in a high Electromagnetic field (EMF) area and communication issues exists, a 14/2 stranded shielded wire can be used to replace L2 and (S) between outdoor unit and indoor unit landing the shield onto ground in the outdoor unit only.

CAUTION

EOUIPMENT DAMAGE HAZARD

Failure to follow this caution may result in equipment damage or improper operation.

Wires should be sized based on NEC and local codes.

CAUTION

EQUIPMENT DAMAGE HAZARD

Failure to follow this caution may result in equipment damage or improper operation.

Be sure to comply with local codes while running wire from the indoor unit to the outdoor unit.

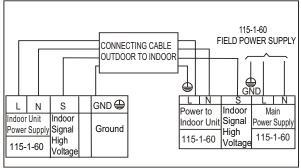

Every wire must be connected firmly. Loose wiring may cause the terminal to overheat or result in unit malfunction. A fire hazard may also exist. Ensure all wiring is tightly connected.

No wire should touch the refrigerant tubing, compressor or any moving parts.

Disconnecting means must be provided and shall be located within sight and readily accessible from the air conditioner.

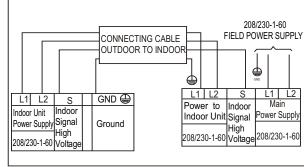

Connecting cable with conduit shall be routed through the hole in the conduit panel.

CONNECTION DIAGRAM

9K to 36K 230V Indoor Unit

9K to 36K 230V Outdoor Unit

Fig. 6 - 208-230V

Notes:

- Do not use thermostat wire for any connection between indoor and outdoor units.
- 2. All connections between indoor and outdoor units must be as shown. The connections are polarity sensitive and improper wiring will result in a fault code.

REFRIGERATION CYCLE DIAGRAM

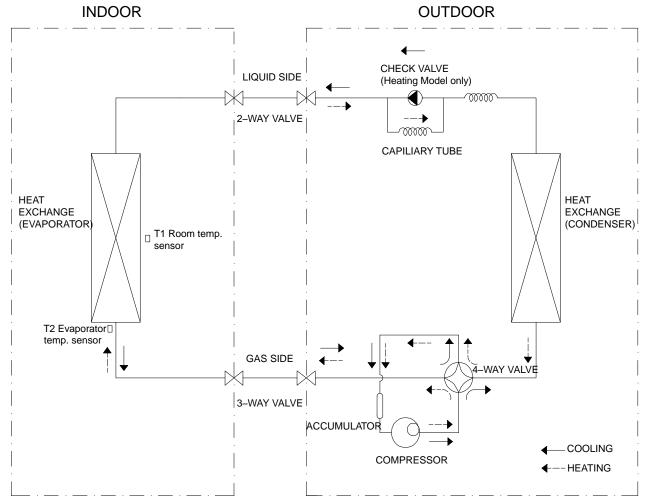

Fig. 10 - Heat Pumps

REFRIGERANT LINES

IMPORTANT: Both refrigerant lines must be insulated separately.

Table 2 lists the pipe sizes for the indoor unit. Refer to the outdoor unit installation instructions for other allowed piping lengths and refrigerant information.

SYSTEM EVACUATION AND CHARGING

A CAUTION

UNIT DAMAGE HAZARD

Failure to follow this caution may result in equipment damage or improper operation.

Never use the system compressor as a vacuum pump.

Refrigerant tubes and indoor coil should be evacuated using the recommended deep vacuum method of 500 microns. The alternate triple evacuation method may be used if the following procedure is followed. Always break a vacuum with dry nitrogen.

System Vacuum and Charge

Using Vacuum Pump

- Completely tighten flare nuts on the line set at both the indoor and outdoor units. DO NOT open the service valves on the outdoor unit for the new installation or the replacement unit. Open the service valves on the outdoor unit if repairs have been made to the refrigerant sealed system. Connect the manifold gauge low pressure hose to the charge port of the gas side service valve (see Fig. 11).
- 2. Connect the charge hose to the vacuum pump.
- 3. Fully open the low pressure valve of manifold gage (see Fig. 12).
- 4. Start the vacuum pump.
- 5. Evacuate using deep vacuum or triple evacuation method.
- After evacuation is complete, fully close the pressure valve side of manifold gage and stop the vacuum pump operation.
- 7. The factory charge contained in the outdoor unit is good for up to 25ft. (8 m) of line length. If vacuum is complete per Fig. 10 or 11, open service valves to release factory charge into the system.
- Disconnect the charge hose from the charge connection of the gas side service valve.
- 9. Securely tighten the service valve caps.

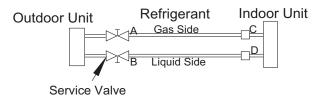

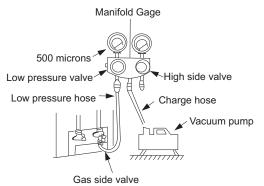

Fig. 11 - Service Valve

Deep Vacuum Method

The deep vacuum method requires a vacuum pump capable of pulling a vacuum of 500 microns and a vacuum gage capable of accurately measuring this vacuum depth. The deep vacuum method is the most positive way of assuring a system is free of air and liquid water (see Fig. 13).

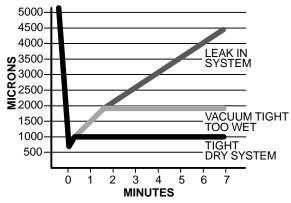

Fig. 13 - Deep Vacuum Graph

Triple Evacuation Method

The triple evacuation method should be used. Refer to Fig. 14 and proceed as follows:

- 1. Pump the system down to 1500 microns and allow the pump to continue operating for an additional 15 minutes.
- 2. Close the service valves and shut off the vacuum pump.
- Connect a dry nitrogen cylinder and regulator to the system and break vacuum until the system reaches 2 psig.
- Close the service valve and allow the system to stand for 1hr.
 During this time, the dry nitrogen can diffuse throughout the system absorbing moisture.
- 5. Pump the system down to 1000 microns.
- 6. Break the vacuum with dry nitrogen (2 psig).
- 7. Pump the system down to 500 microns.
- 8. Perform the hold test for 30 minutes.

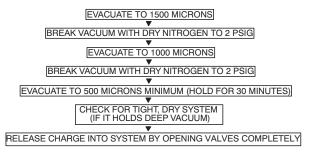

Fig. 14 - Triple Evacuation Method

Final Tubing Check

IMPORTANT: Check to be certain factory tubing on both indoor and outdoor unit has not shifted during shipment. Ensure tubes are not rubbing against each other or any sheet metal. Pay close attention to feeder tubes, making sure wire ties on feeder tubes are secure and tight.

OPERATION MODES AND FUNCTIONS

Abbreviation

Table 10—Unit Element Abbreviations

Abbreviation	Element
T1	Indoor room temperature
T2	Evaporator Coil temperature
Т3	Condenser Coil temperature
T4	Outdoor ambient temperature
Tsc	Adjusted setting temperature
TP	Compressor discharge temperature

Safety Features

Compressor Three-Minute Delay at Restart

Compressor functions are delayed for up to ten seconds upon the first start-up of the unit, and are delayed for up to three minutes upon subsequent unit restarts.

Automatic shutoff based on discharge temperature

If the compressor discharge temperature exceeds 226°F (108°C) for nine seconds, the compressor ceases operation.

Automatic shutoff based on fan speed

If the indoor fan speed registers below 300RPM or over 1500RPM for an extended period of time, the unit ceases operation and the corresponding error code is displayed on the indoor unit.

Inverter module protection

The inverter module has an automatic shutoff mechanism based on the unit's current, voltage, and temperature. If automatic shutoff is initiated, the corresponding error code is displayed on the indoor unit and the unit ceases operation.

Indoor fan delayed operation

- When the unit starts, the louver is automaticallyactivated and the indoor fan will operate after a period of setting time or when the louver is in place.
- If the unit is in **HEATING** mode, the indoor fan is regulated by the anti-cold wind function.

Compressor Preheating

Preheating is automatically activated when the T4 sensor is lower than setting temperature.

Sensor redundancy and automatic shutoff

- If one temperature sensor malfunctions, the air conditioner continues operation and displays the corresponding error code, allowing for emergency use.
- When more than one temperature sensor malfunctions, the air conditioner ceases operation.

Display Function

Unit Display Functions

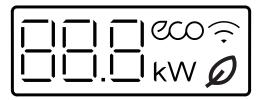

Fig. 15 - Unit Display Functions

Table 11—Unit Function Displays

Function	Display
Temperature	Set temperature value
Temperature (FAN and DRYING mode)	Room temperature
Activation of Timer ON, Fresh, Swing, Turbo, or Silent	(3s)
Cancellation of Timer OFF, Fresh, Swing, Turbo, or Silent	(3s)
Defrost	d
Warming in heating mode	cF
Self-clean	50
Heating in room temp under 46°F (8°C) or 54°F (12°C)	FP
Fresh (Not available on these systems)	Ø
ECO function	eco
WiFi control (Not available on these systems)	(:-
The current operation power (Not available on these systems)	kW

FAN Mode

When the FAN mode is activated:

- The outdoor fan and compressor stop.
- Temperature control is disabled and the indoor room temperature is displayed.
- The indoor fan speed can be set to 1%~100%, or **AUTO**.
- The louver operations are identical to those in COOLING mode.
- Auto fan: In FAN-ONLY mode, the AC operates the same as auto fan in the COOLING mode with the temperature set at 75°F 24°C (Tsc =75°F (24°C).

COOLING Mode

Compressor Control

Reach the configured temperature:

- When the compressor runs continuously for less than 120 minutes.
- If the following conditions are satisfied, the compressor ceases operation.
 - While the calculated frequency(fb) is less than the minimum limit frequency(FminC).
 - While protective time is more than or equal to ten minutes.
 - While T1 is lower than or equal toTsc-CDIFTEMP-0.9°F (0.5°C)

NOTE: CDIFTEMP is the EEPROM setting parameter. It is 3.6° F (2° C) usually.

- When the compressor runs continuously for more than 120 minutes.
- If the following conditions are satisfied, the compressor ceases operation.
 - When calculated frequency(fb) is less than minimum limit frequency(FminC).
 - When protective time is more than or equal to ten
 - When T1 is lower than or equal to (Tsc-CDIFTEMP).

NOTE: CDIFTEMP is the EEPROM setting parameter. It is 3.6° F (-16° C) usually.

- 3. If one of the following conditions is satisfied, regardless of time.
- Compressor running frequency is more than the test frequency.
- When the compressor running frequency is equal to the test frequency, T4 is more than 59°F (15°C) or no T4 or T4 fault.
- Change setting temperature
- Turbo or sleep function on/off
- Various frequency limit shutdown occurs

NOTE: CDIFTEMP is EEPROM setting parameter. It is $35.6^{\circ}F$ ($2^{\circ}C$) usually.

Indoor Fan Control

- 1. In the **COOLING** mode, the indoor fan operates continuously. The fan speed can be set to 1%–100%, or **AUTO**.
- 2. AUTO fan
- Descent Curve
 - When T1–Tsc is lower than or equal to 3.6° F (-16° C), fan speed reduces to 80%;
 - When T1–Tsc is lower than or equal to $1.8^{\circ}F$ (-17°C), fan speed reduces to 60%;
 - When T1-Tsc is lower than or equal to 0.9°F (-17.3°C), fan speed reduces to 40%;
 - When T1–Tsc is lower than or equal to 0° F (-18 $^{\circ}$ C), fan speed reduces to 20%;
 - When T1–Tsc is lower than or equal to -0.9° F (-17.2° C), fan speed reduces to 1%.
- Rise Curve
 - When T1–Tsc is higher than 0° F (-18° C), fan speed increases to 20%;
 - When T1–Tsc is higher than 0.9°F (-17.3°C), fan speed increases to 40%;
 - When T1–Tsc is higher than 1.8° F (-17° C), fan speed increases to 60%;
 - When T1–Tsc is higher than $2.7^{\circ}F$ ($-16^{\circ}C$), fan speed increases to 80%;
 - $\bullet~$ When T1–Tsc is higher than 7.2 $^{\circ}F$ (–14C), fan speed increases to 100% .

Outdoor Fan Control

- The outdoor unit runs at a different fan speed according to T4 and the compressor running frequency.
- For different outdoor units, the fan speeds are different.

Condenser Temperature Protection

When the condenser temperature exceeds a configured value, the compressor ceases operations.

Evaporator Temperature Protection

When the evaporator temperature drops below a configured value, the compressor and outdoor fan ceases operations.

HEATING Mode

Compressor Control

- 1. Reach the configured temperature:
- If the following conditions are satisfied, the compressor ceases operation.
 - While the calculated frequency(fb) is less than the minimum limit frequency(FminC).
 - When the protective time is more than or equal to ten minutes.
 - When T1 is higher than or equal to Tsc+HDIFTEMP2.

NOTE: HDIFTEMP2 is the EEPROM setting parameter. It is 35.6°F (2°C) usually.

- If one of the following conditions is satisfied, regardless of time.
 - Compressor running frequency is more than test frequency.
 - When the compressor running frequency is equal to the test frequency, T4 is more than 59°F (15°C) or no T4 or T4 fault.
 - Change the setting temperature.
 - Turbo or sleep function on or off.
- When the current is higher than the predefined safe value, the surge protection is activated, causing the compressor to cease operations.

Indoor Fan Control

- 1. In the **HEATING** mode, the indoor fan operates continuously. The fan speed can be set to 1%–100%, or muted.
- 2. AUTO fan
- Rise curve
 - When T1–Tsc is higher than -2.7° F (-19° C), fan speed reduces to 80%;
 - When T1–Tsc is higher than 0° F (-18° C), fan speed reduces to 60%;
 - When T1–Tsc is higher than $0.9^{\circ}F$ (-17°C), fan speed reduces to 40%;
 - When T1–Tsc is higher than $1.8^{\circ}F$ (-17°C), fan speed reduces to 20%.
- Descent curve
 - When T1–Tsc is lower than or equal to $0.9^{\circ}F$ (-17°C), fan speed increases to 20%;
 - When T1–Tsc is lower than or equal to 0° F (-18 $^{\circ}$ C), fan speed increases to 60%;
 - When T1–Tsc is lower than or equal to -2.7° F (-19° C), fan speed increases to 80%;
 - When T1–Tsc is lower than or equal to -5.4 °F (-21 °C), fan speed increases to 100%.

Outdoor Fan Control

- The outdoor unit runs at a different fan speed according to T4 and compressor running frequency.
- For different outdoor units, the fan speeds differ.

DEFROSTING Mode

- The unit enters defrosting mode according to changes in the temperature value of T3, T4 as well as the compressor running time.
- In defrosting mode, the compressor continues to run, the indoor and outdoor motor will cease operation, the defrost light of the indoor unit will turn on, and the " symbol appears.
- If any one of the following conditions is satisfied, defrosting ends and the machine switches to the normal HEATING mode:
 - T3 rises above TCDE1°C.
 - T3 maintained above TCDE2°C for 80 seconds.
 - Unit runs for 15 minutes consecutively in the **DEFROSTING** mode.

Evaporator Temperature Protection

- Off: Compressor stops.
- Decrease: Decrease the running frequency to the lower level per 20 seconds.
- Hold: Keep the current frequency.
- Resume: No limitation for frequency.

AUTO Mode

- This mode can be selected with the remote controller and the setting temperature can be changed between 61°F~86°F (16°C~30°C).
- In the AUTO mode, the machine selects the COOLING, HEATING, AUTO-DRYING or FAN-ONY mode on the basis of T1.Ts, T4 and relative humidity.
- If the setting temperature is modified, the machine selects a new running function.

DRY Mode

In the **DRY** mode, the air conditioner operates the same as auto fan in the **COOLING** mode.

- 1. Mute function is active.
- All protections are activated and operate the same as they do that in COOLING mode.
- 2. Low Room Temperature Protection
- If the room temperature is lower than 10°C, the compressor ceases operations and does not resume until the room temperature exceeds 12°C.

Forced Operation Function

• Forced **COOLING** Mode:

The compressor and outdoor fan continue to run and the indoor fan runs at rated speed. After running for 30 minutes, the air conditioner switches to **AUTO** mode with a preset temperature of 24° C.

Forced AUTO Mode:

Forced auto mode operates the same as normal AUTO mode with a preset temperature of $24^{\circ}C$.

- The unit exits the forced operation when it receives the following signals:
 - Switch on
 - Switch off
 - · Timer on
 - Timer off
 - Changes in:
 - Mode
 - Fan Speed
 - Setting Temperature

Timer Function

- The Timing range is 24 hours.
- Timer on. The machine will turn on automatically when reaching the setting time.
- Timer off. The machine will turn off automatically when reaching the setting time.
- Timer on/off. The machine will turn on automatically when reaching the setting "on" time, and then turn off automatically when reaching the setting "off" time.
- Timer off/on. The machine will turn off automatically when reaching the setting "off" time, and then turn on automatically when reaching the setting "on" time.
- The timer function will not change the AC current operation mode. Suppose AC is off now, it will not start up firstly after setting the "timer off" function. And when reaching the setting time, the timer LED will be off and the AC running mode has not been changed.
- The setting time is relative time.
- The AC will quit the timer function when it has malfunction

SLEEP Function

- The SLEEP function is available in COOLING, HEATING, or AUTO modes.
- The operational process for sleep mode is as follows:
 - When cooling, the temperature rises $1.8^{\circ}F$ ($-17^{\circ}C$) (to not higher than $86^{\circ}F$ ($30^{\circ}C$) every hour. After 2 hours, the temperature stops rising and the indoor fan is fixed at low speed.
 - When heating, the temperature decreases 1.8°F (-17°C) (to not lower than 61°F (16°C)) every hour. After 2 hours, the temperature stops decreasing and the indoor fan is fixed at low speed. Anti–cold wind function takes priority.
- The operating time for the SLEEP mode is 8 hours, after which, the unit exits this mode and turns off.
- The timer setting is available in this mode.

Auto-Restart Function

- The indoor unit has an auto—restart module that allows the unit to restart automatically. The module automatically stores the current settings and, in the case of a sudden power failure, will restore those setting automatically within 3 minutes after power returns.
- If there is a power failure while the unit is running, the compressor starts 3 minutes after the unit restarts. If the unit was already off before the power failure, the unit stands by.

46F (8°C) Heating

In the **HEATING** mode, the temperature can be set to as low as 46° F (8° C), preventing the indoor area from freezing if unoccupied during severe cold weather.

ECO Function

- Used to enter the energy efficient mode.
 - Under the **COOLING** mode, press **ECO**, the remote controller adjusts the temperature automatically to 75°F (24°C), **AUTO** fan speed to save energy (however only if the set temperature is less than 75°F (24°C). If the set temperature is more than 75°F (24°C) and 86°F (30°C), press **ECO**, the fan speed will change to **AUTO**, the set temperature will remain unchanged.
- When AC receives signals, such as switch off, Turbo operation, Silence operation, Self clean operation, Forced COOLING operation, mode setting, Sleeping mode, or adjusting the set temperature to less than 75°F (24°C), it will exit the ECO operation.
- Operation time in ECO mode is 8 hours. After 8 hours the air conditioner exits this mode.
- If there is a malfunctioning temperature sensor in, the air conditioner will exit ECO mode.
- The indoor fan runs at auto fan when it enters the ECO mode. The setting temperature and setting fan speed can be changed with the remote controller.

Self Clean

- Press "Self Clean" when the unit is in the COOLING or DRYING mode, the indoor unit will run at the low fan speed for 16 minutes then turn off.
- Self Clean keeps the indoor unit dry and prevents mold growth.

Follow Me

- If you press "Follow Me" on the remote controller, the indoor unit will beep. This indicates the "Follow Me" function is active.
- Once active, the remote controller will send a signal every 3 minutes, with no beeps. The unit automatically sets the temperature according to the measurements from the remote controller.
- The unit will only change modes if the information from the remote controller makes it necessary, not from the unit's temperature setting.
- If the unit does not receive a signal for 7 minutes or you press "Follow Me," the function turns off. The unit regulates temperature based on its own sensor and settings.

Silence

Press **SILENCE** on the remote controller to enable the **SILENCE** function. While this function is active, the indoor unit will run at faint breeze (1% fan speed), which reduces noise to the lowest possible level.

Electrical Energy Consumption Control Function

Press **GEAR** on remote controller to enter the energy efficient mode (see Fig. 16).

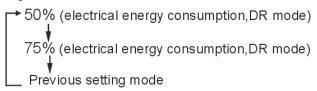

Fig. 16 — Electrical Energy Consumption Control Function

Information Inquiry

To enter information inquiry status, complete the following procedure within ten seconds:

- Press **LED** 3 times.
- Press **SWING** 3 times.
- If successful, you will hear beeps for two seconds.
- Use LED and SWING to cycle through the information displayed.
- Press LED to display the next code in the sequence. Press SWING to display the previous code.

Table 12 displays the information codes. The screen displays the code for two seconds, then the information for 25 seconds.

Table 12—Information Codes

Displayed Code	Explanation	Additional Notes
T1	T1	T1 temperature
T2	T2	T2 temperature
T3	Т3	T3 temperature
T4	T4	T4 temperature
TP	TP	TP temperature
Targeted Frequency	FT	Targeted Frequency
Actual Frequency	TR	Actual Frequency
Compressor Current	dL	N/A
Outdoor AC Voltage	UO	N/A
Indoor capacity test	Sn	N/A
Reserve		Running mode
Outdoor Fan Speed	Pr	Outdoor fan speed
EXV opening angle	LR	EXV opening angle
Indoor fan speed	IR	Indoor fan speed
Indoor humidity	HU	N/A
Adjusted setting temperature	TT	N/A
Indoor dust concentrations	DT	N/A
WIFI signal strength	IF	N/A
GA algorithm frequency	ОТ	N/A

A WARNING

UNIT DAMAGE HAZARD

Electricity remains in capacitors even when the power supply is off. Ensure the capacitors are fully discharged before troubleshooting.

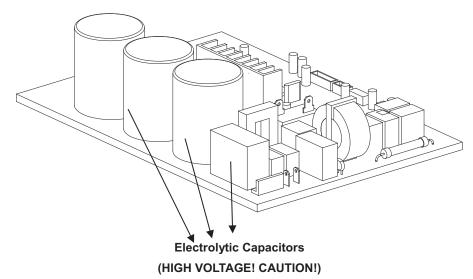

Fig. 17 - Electrolytic Capacitors

For other models, please connect discharge resistance (approximately 100Ω 40W) or a soldering iron (plug) between the +, – terminals of the electrolytic capacitor on the contrary side of the outdoor PCB.

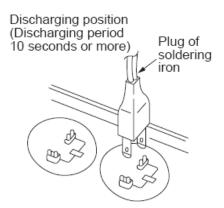

Fig. 18 - Discharge Position

NOTE: Fig. 18 is for reference only. Actual appearances may vary.

TROUBLESHOOTING (CONT)

Error Display (Indoor Unit)

When the indoor unit encounters a recognized error, the indicator light flashes in a corresponding series, the timer display may turn on or begin flashing, and an error code displays. These error codes are described in Table 13.

Table 13—Error Codes

Display	Error Information	Solution
EO/EA	Indoor unit EEPROM parameter error	Page 23
ΕЪ	Indoor / outdoor units communication error	Pages 24 – 25
E3	The indoor fan speed is operating outside of the normal range	Page 26
E4	Indoor room temperature sensor T1 is in open circuit or has short circuited	Pages 23 and 32
E5	Evaporator coil temperature sensor T2 is in open circuit or has short circuited	Page 32
EB	Communication error between the indoor PCB and display board	Page 33
EF	Intelligent eye module error	Page 28
FO	Overload current protection	Page 34
FЪ	Outdoor ambient temperature sensor T4 open circuit or short circuit	Page 32
F2	Condenser coil temperature sensor T3 is in open circuit or has short circuited	Page 32
F3	Compressor discharge temperature sensor TP open circuit or short circuit	Page 32
F4	Outdoor unit EEPROM parameter error	Page 23
F5	The outdoor fan speed is operating outside of the normal range	Page 26
PO	IPM malfunction or IGBT over-strong current protection	Page 35
PΙ	Over voltage or over low voltage protection	Page 29
P2	High temperature protection of IPM module	Page 30
Р4	Inverter compressor drive error	Page 31

For other codes

The display board may show a garbled code or a code undefined by the service manual. Ensure that this code is not a temperature reading.

Troubleshooting

Test the indoor unit using the remote controller. If the unit display is working however will not respond to the remote, the indoor PCB requires replacement. If there is no display after pressing the "LED" button and the unit responds, the display board requires replacement.

ERROR DIAGNOSIS AND TROUBLESHOOTING WITHOUT ERROR CODE

A WARNING

UNIT DAMAGE HAZARD

Be sure to turn off unit before any maintenance to prevent damage or injury.

Table 14—Remote Maintenance

Remote Maintenance			Ele	ectrical Circuit	1					R	efrigerant Circuit							Others		
Possible causes of trouble	Power failure	The main power tripped	Loose connections	Faulty transformer	The voltage is too high or too low	The remote control is powered off	Broken remote control	Dirty air filter	Dirty condenser fins	The setting temp is higher/lower than the room's (cooling/heating)	The ambient temp. is too high/low when the mode is cooling/heating	Fan mode	SILENCE function is activated (optional function)	Frosting and defrosting frequently	Heavy load condition	Loose hold down bolts and/or screws	Not air tight	Air inlet or outlet of either unit is blocked	Interference from cell phones towers and remote boosters	Shipping plates remained attached

TROUBLESHOOTING BY ERROR CODE

Common Check Procedures

Temperature Sensor Check

Disconnect the temperature sensor from PCB, measure the resistance value with a tester.

Temperature Sensors.

Room temp. (T1) sensor,

Indoor coil temp. (T2) sensor,

Outdoor coil temp.(T3) sensor,

Outdoor ambient temp.(T4) sensor,

Compressor discharge temp.(Tp) sensor.

Measure the resistance value of each winding by using the multi-meter.

Compressor Checking

Measure the resistance value of each winding by using the tester.

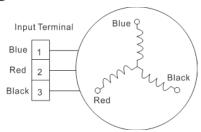

Fig. 19 — Compressor Checking

Table 20—Compressor Checking

Position		Resistance Value	
	ASN98D22UFZ	ATM115D43UFZ2	ATF235D22UMT
Blue – Red			
Blue – Black	1.57Ω(20°C/68°F)	1.87Ω(20°C/68°F)	0.75Ω(20°C/68°F)
Red – Blue			

Fig. 20 — Compressor Checking

IPM Continuity Check

Turn off the power, let the large capacity electrolytic capacitors discharge completely, and dismount the IPM. Use a digital tester to measure the resistance between P and UVWN; UVW and N.

Table 21—IPM Continuity Check

Digita	l Tester	Normal Resistance Value	Digital	Tester	Normal Resistance Value
(+) Red	(–) Black		(+) Red	(–) Black	
	N	\rfloor	U		
D	U		V	N	(Soveral MO)
Р	V	(Several M Ω)	W	N	(Several MΩ)
	W		(+) Red		

DIAGNOSIS AND SOLUTION

E0/F4/EA (EEPROM Parameter Error)

Description: Indoor or outdoor PCB main chip does not receive feedback from EEPROM chip.

Recommended parts to prepare:

- Indoor PCB
- Outdoor PCB

Troubleshooting and Repair:

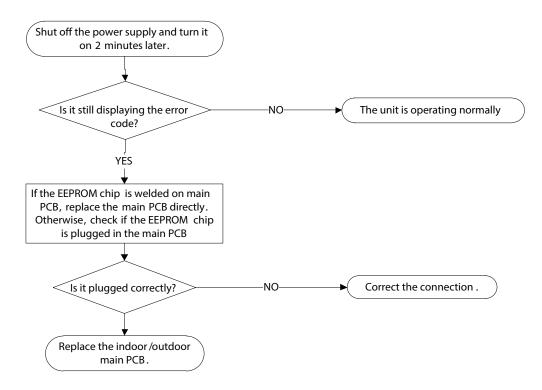

Fig. 21 — Troubleshooting

Remarks:

The location of the EEPROM chip on the indoor and outdoor PCB is shown in Figures 22 and 23:

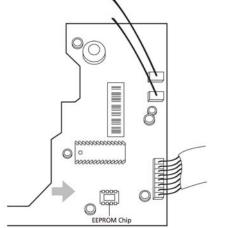

Fig. 22 — EEPROM Chip (Indoor Unit)

EEPROM Chip

Fig. 23 - EEPROM Chip (Outdoor Unit)

NOTE: These images are for reference only.

E1 (Indoor and Outdoor Unit Communication Error)

Description: The indoor unit has not received feedback from the outdoor unit for 150 seconds, four consecutive times. **Recommended parts to prepare:**

- Indoor PCB
- Outdoor PCB
- Reactor

Troubleshooting and Repair:

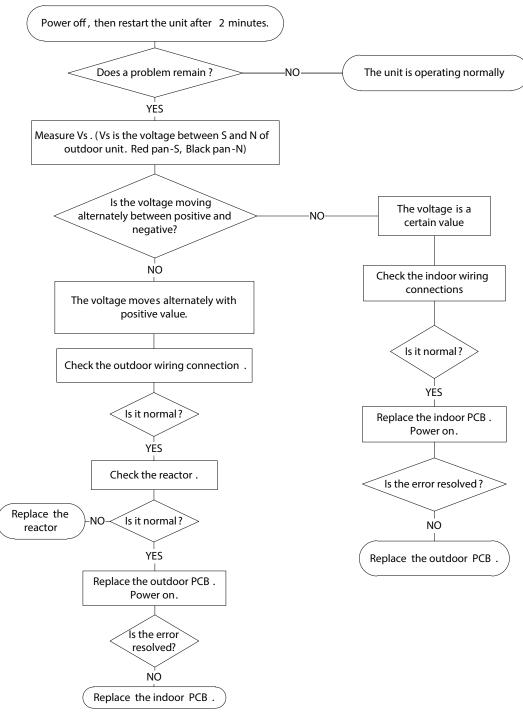

Fig. 24 - Troubleshooting

E1 (Indoor and Outdoor Unit Communication Error) (Cont)

Remarks:

- Use a multimeter to test the DC voltage between the outdoor unit's 2 port and 3 port. The red pin of multimeter connects with the 2 port while the black pin is for 3 port.
- When the air conditioner is normal running, the voltage is moving alternately as positive values and negative values.
- If the outdoor unit has a malfunction, the voltage has always been the positive value.
- If the indoor unit has malfunction, the voltage is a fixed value.

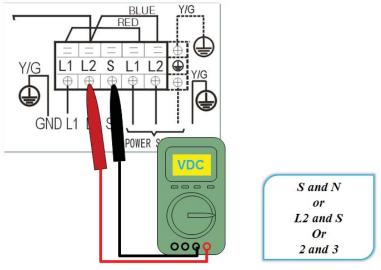

Fig. 25 - Multimeter

- Use a multimeter to test the resistance of the reactor that does not connect with the capacitor.
- The normal value should be around zero ohm. Otherwise, the reactor must have malfunction.

Fig. 26 - Multimeter

E3/F5 (Fan speed is operating outside of the Normal Range)

Description: When the indoor fan speed maintains a low speed (ex. 300RPM) or a speed that's too high (ex.1500RPM) for a certain time, the unit stops and the LED displays the failure (E3). When the outdoor fan speed registers below 200RPM or over 1500RPM for an extended period of time, the unit stops and the LED displays the failure (F5).

Recommended parts to prepare:

- Wiring
- Faulty fan assembly
- Faulty fan motor
- Faulty PCB

Troubleshooting and Repair:

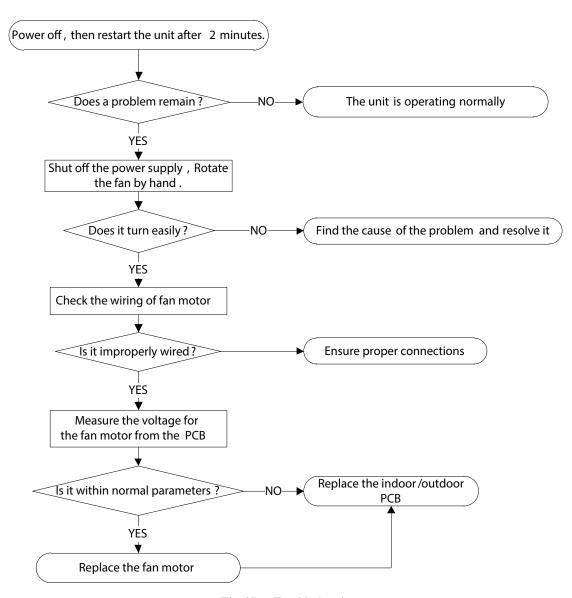

Fig. 27 - Troubleshooting

Index

1. Indoor or Outdoor DC Fan Motor (control chip is in fan motor)

Power on and when the unit is in standby, measure the voltage of pin1-pin3, pin4-pin3 in the fan motor connector. If the value of the voltage is not in the range shown in Table 22, the PCB must has problems and need to be replaced.

• DC motor voltage input and output (voltage: 220–240V~):

Table 22—Voltage

No.	Color	Signal	Voltage
1	Red	Vs/Vm	280V~380V
2			
3	Black	GND	0V
4	White	Vcc	14-18.5V
5	Yellow	Vsp	0~5.6V
6	Blue	FG	14—18.5V

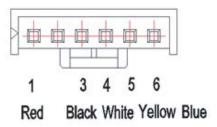

Fig. 28 - Indoor DC Fan Motor

2. Outdoor DC Fan Motor (control chip is in outdoor PCB)

Power on and check if the fan can run normally, if the fan can run normally, the PCB must have a problem and needs to be replaced, If the fan can not run normally, measure the resistance of each pin (two). If the resistance is not equal to each other, the fan motor must have a problem and needs to be replaced, otherwise the PCB must has problems and needs to be replaced.

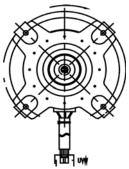

Fig. 29 - Outdoor DC Fan Motor

3. Indoor AC Fan Motor

Power on and set the unit running in FAN mode at the high fan speed. After running for 15 seconds, measure the voltage of pin1 and pin2. If the value of the voltage is less than 100V(208~240V power supply) or 50V(115V power supply), the PCB must has problems and needs to be replaced.

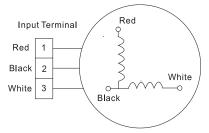

Fig. 30 - Indoor AC Fan Motor

E4/E5/F1/F2/F3 (Open circuit or short circuit of temperature sensor diagnosis and solution)

Description: If the sampling voltage is lower than 0.06V or higher than 4.94V, the LED displays the failure. **Recommended parts to prepare:**

- Wiring mistake
- Faulty sensor
- Faulty PCB

Troubleshooting and Repair:

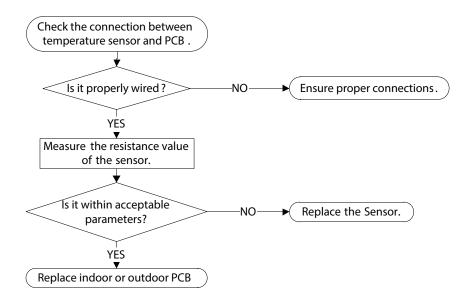

Fig. 31 - Troubleshooting

Fig. 32 - Multimeter

Eb (Communication error between the Indoor PCB and Display Board)

Description: Indoor PCB does not receive feedback from the display board.

Recommended parts to prepare:

- Wiring mistake
- PCB faulty
- Display board malfunction

Troubleshooting and Repair:

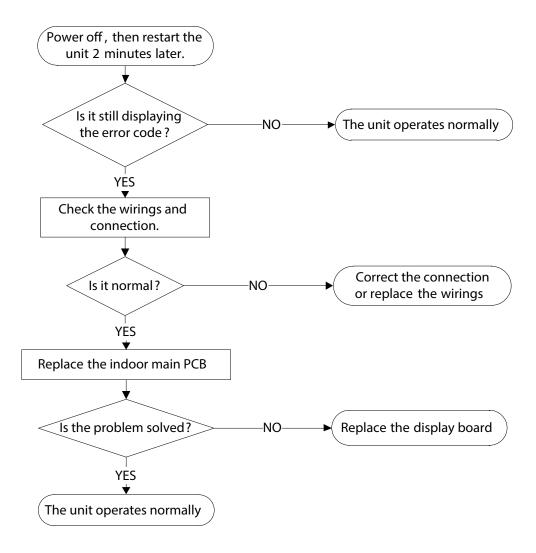

Fig. 33 - Troubleshooting

33

EC (Refrigerant Leakage Detection diagnosis and solution)

Description: Define the evaporator coil temperature T2 of the compressor just starts running as Tcool.

In the beginning 5 minutes after the compressor starts up, if $T2<Tcool-2^{\circ}C$ does not keep continuous 4 seconds and this situation happens 3 times, the display area will show "EC" and the AC will turn off.

Recommended parts to prepare:

- Faulty T2 sensor
- Faulty indoor PCB
- System problems, such as leakage or blockages

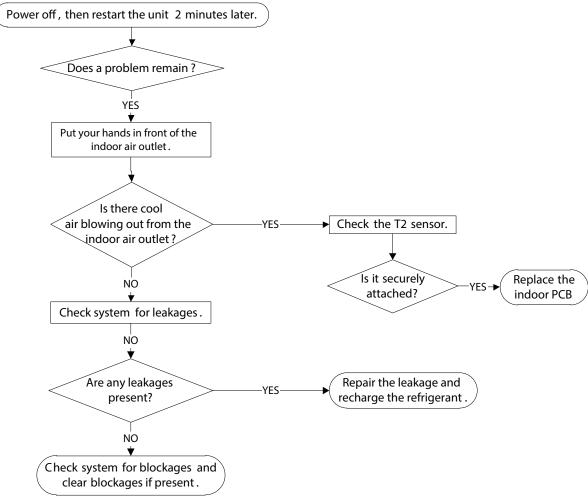

Fig. 34 - Troubleshooting

F0 (Overload current protection diagnosis and solution)

Description: An abnormal current rise is detected by checking the specified current detection circuit. **Recommended parts to prepare:**

- Power supply problems
- System blockage
- Faulty PCB
- Wiring mistake
- Compressor malfunction

Troubleshooting and Repair:

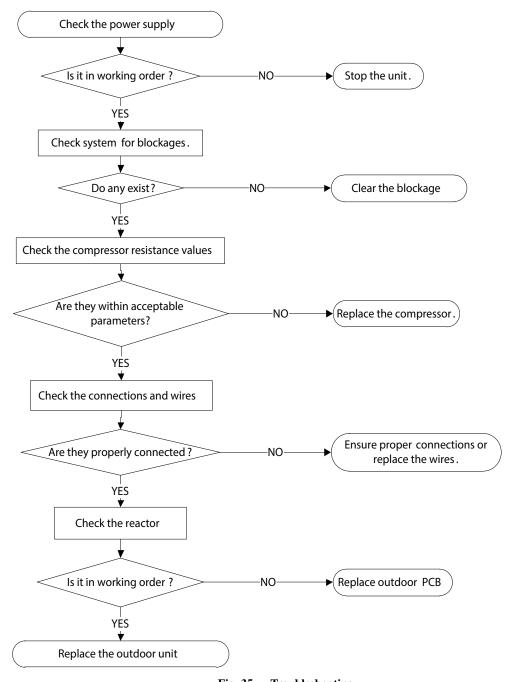

Fig. 35 — Troubleshooting

P0 (IPM malfunction or IGBT over-strong current protection diagnosis and solution)

Description: When the voltage signal the IPM sends to the compressor drive chip is abnormal, the display LED displays "P0" and the air conditioner turns off.

Recommended parts to prepare:

- Wiring mistake
- IPM malfunction
- Faulty outdoor fan assembly
- Compressor malfunction
- Faulty outdoor PCB

Troubleshooting and Repair:

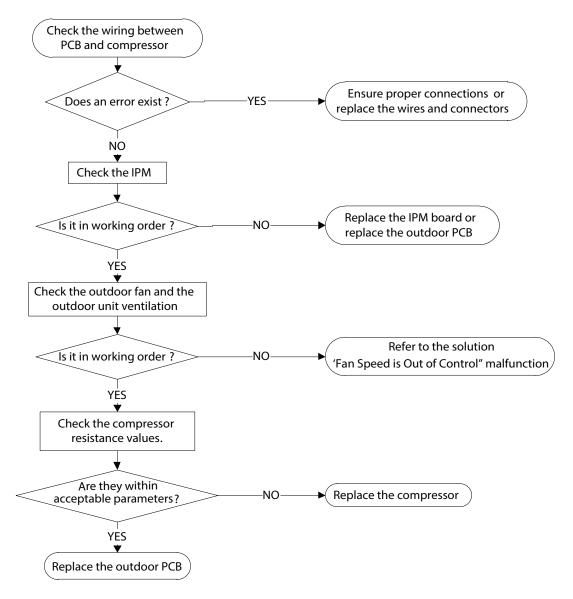

Fig. 36 - Troubleshooting

P1 (Over voltage or too low voltage protection diagnosis and solution)

Description: Abnormal increases or decreases in voltage are detected by checking the specified voltage detection circuit. **Recommended parts to prepare:**

- Power supply issues
- System leakage or blockage
- Faulty PCB

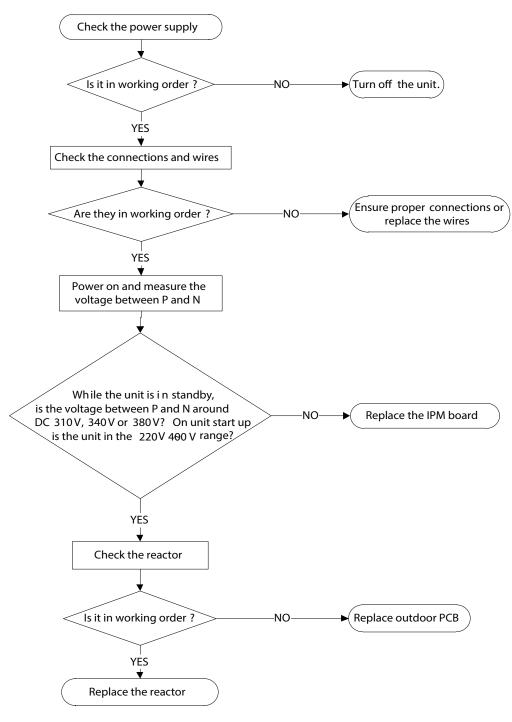

Fig. 37 — Troubleshooting

P2 (High temperature protection of IPM module diagnosis and solution)

Description: If the temperature of IPM module is higher than limited value, the LED displays this failure code. **Recommended parts to prepare:**

- Faulty PCB
- Connection problems

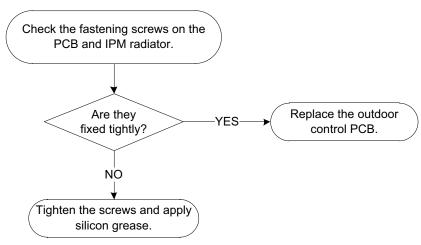

Fig. 38 — Troubleshooting

P4 (Inverter compressor drive error diagnosis and solution)

Description: If the temperature of IPM module is higher than limited value, the LED displays this failure code. **Recommended parts to prepare:**

- Wiring mistake
- PM malfunction
- Outdoor fan assembly faulty
- Compressor malfunction
- Outdoor PCB faulty

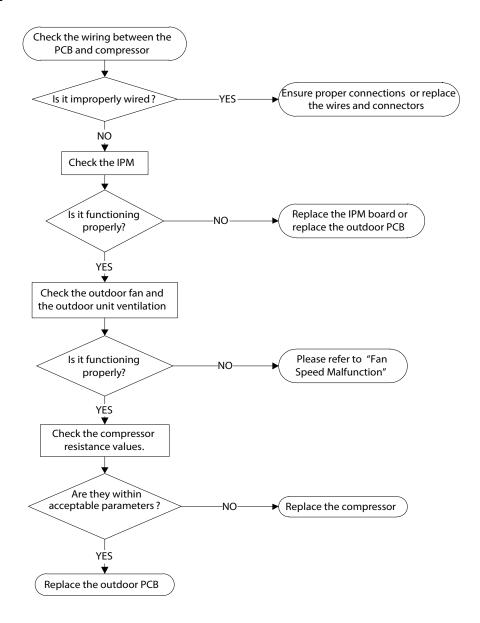

Fig. 39 - Troubleshooting

COMPRESSOR DRIVEN CHIP EEPROM PARAMETER ERROR DIAGNOSIS AND SOLUTION

Description: Outdoor PCB main chip does not receive feedback from compressor driven EEPROM chip.

Recommended parts to prepare:

Outdoor PCB

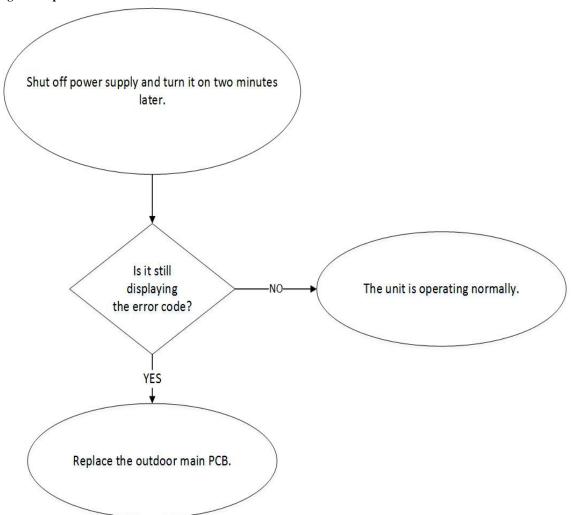

Fig. 40 - Troubleshooting

ZERO SPEED PROTECTION OF COMPRESSOR/ OUTDOOR FAN OR LACK OF PHASE OF COMPRESSOR OR OUTDOOR FAN/COMPRESSOR SPEED MALFUNCTION DIAGNOSIS SOLUTION

Recommended parts to prepare:

- Wiring mistake
- Faulty fan assembly faulty
- Faulty fan motor
- Faulty PCB
- Faulty compressor

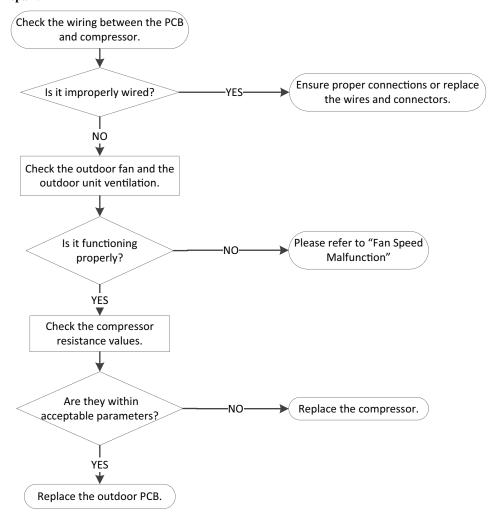

Fig. 41 - Troubleshooting

COMMUNICATION ERROR BETWEEN OUTDOOR MAIN CHIP AND COMPRESSOR DRIVEN CHIP

Recommended parts to prepare:

• Faulty PCB

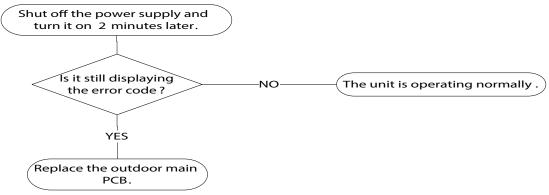

Fig. 42 - Troubleshooting

DISASSEMBLY INSTRUCTIONS

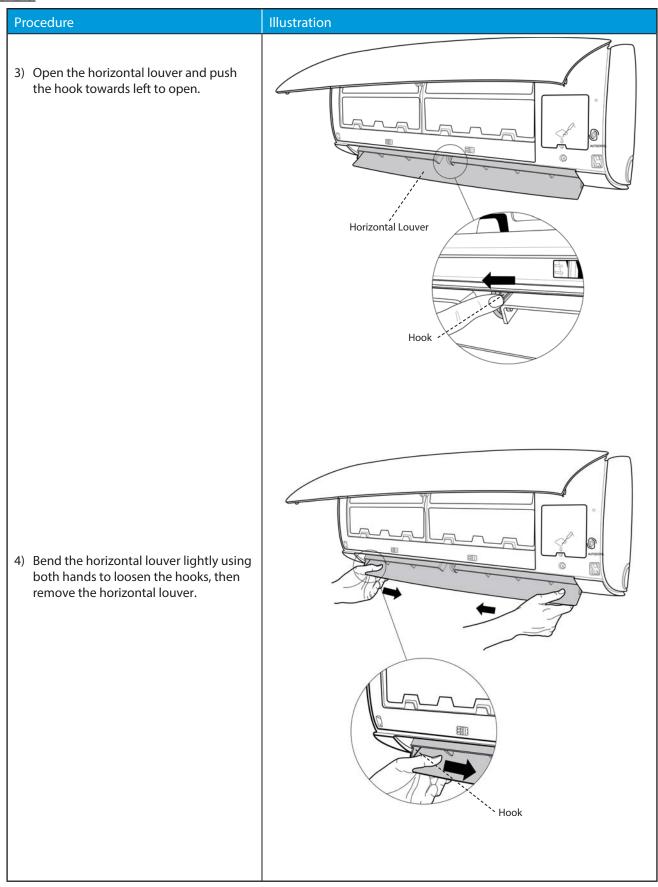

INDOOR UNIT

Front Panel

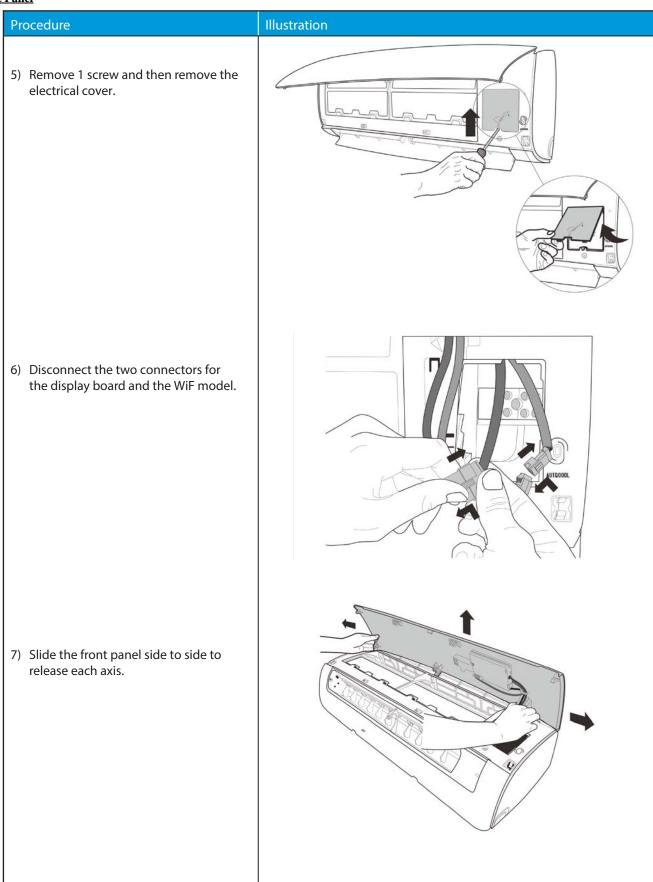

NOTE: This section is for reference only. Actual unit appearance may vary.

Procedure	Illustration
Hold the front panel by the tabs on both sides and lift.	Front Panel Tab
2) Push up the bottom of the air filter (step 1), and then pull it out downwards (step 2).	Filter

INDOOR UNIT

INDOOR UNIT

INDOOR UNIT

Procedure	Illustration
8) Release the 6 hooks of the vertical blades, then pull the vertical blades right and remove it.	
9) Remove 1 screw of the display board.	

INDOOR UNIT

Panel								
Procedure	Illustration							
10) Rotate the display board in the direction shown in the adjacent image.								
11) Remove 1 screw of the WFfi model.								
12) Rotate the wifi model in the direction shown in the right picture.								

INDOOR UNIT

Procedure Procedure	Illustration
13) Open the screw cap and then remove the 2 screws.	
14) Release the 2 hooks.	

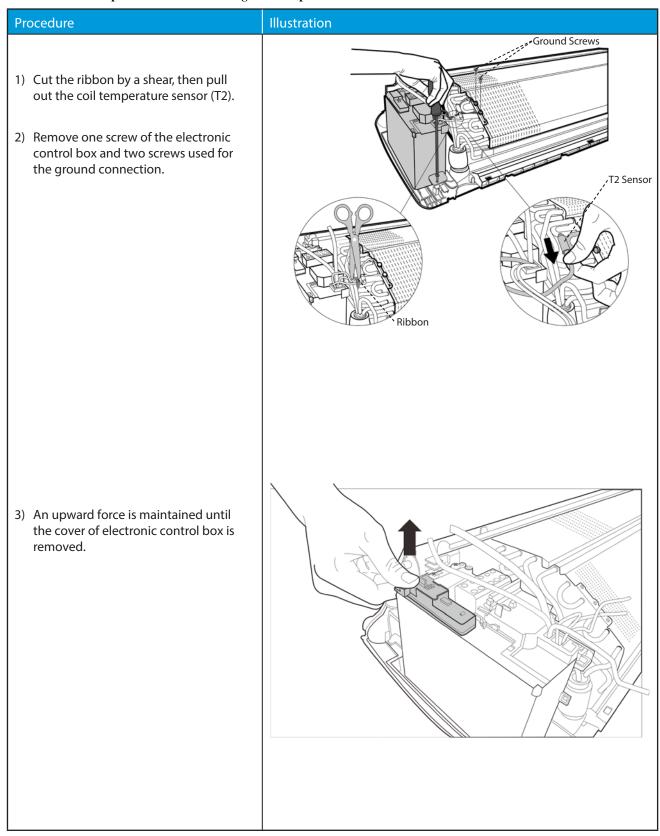

INDOOR UNIT

Procedure	Illustration
15) Release the 5 hooks in the back.	
16) Pull out the panel frame while pushing the hook through a clearance between the panel frame and the heat exchanger.	

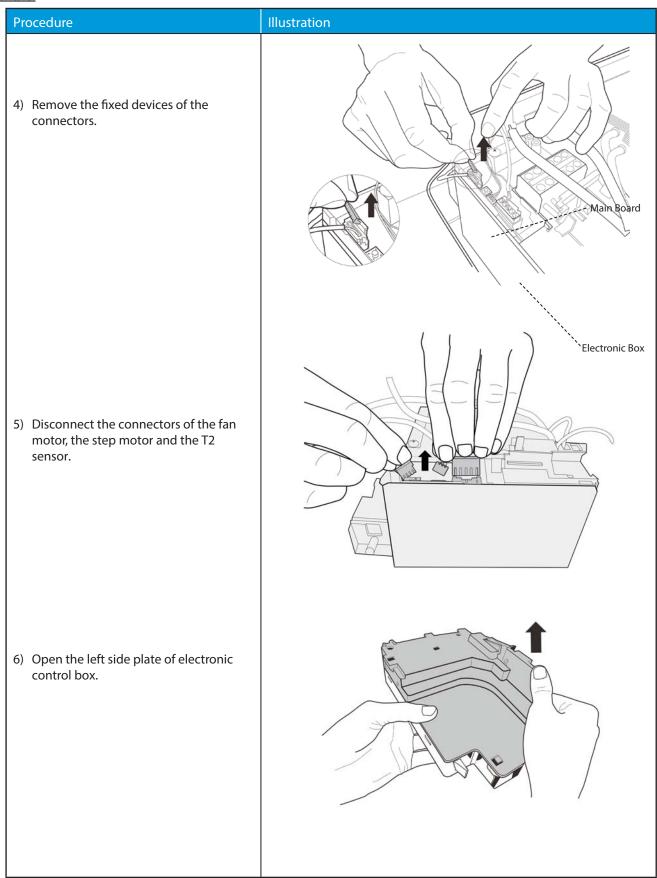

ELECTRICAL PARTS

Front Panel

NOTE: Remove the front panel before disassembling electrical parts.

ELECTRICAL PARTS

ELECTRICAL PARTS

Pr	ocedure	Illustration
7)	Open the left side plate of the electronic control box.	
8)	Remove 1 screw and take down the power wire.	
9)	Remove the two transformer connectors.	

ELECTRICAL PARTS

Procedure	Illustration
10) Open the two clips along the direction indicated.	
11) Pull out the electrical main board along the direction indicated in the image to remove it.	

EVAPORATOR

Front Panel

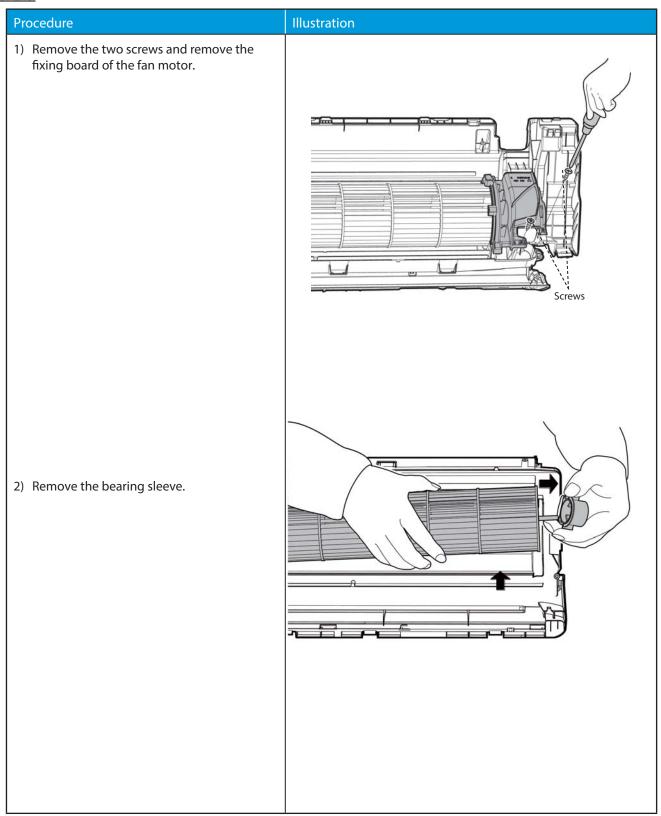

NOTE: Remove the front panel and electrical parts before disassembling the evaporator.

Procedure	Illustration
Disassemble the pipe holder located at the rear of the unit.	Pipe Holder
2) Remove the screw (1) on the evaporator located at the fixed plate.	

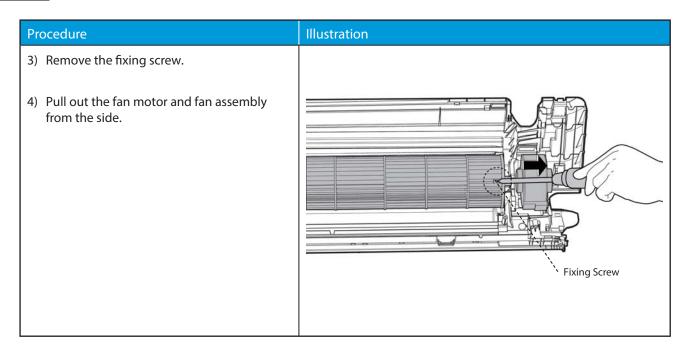

EVAPORATOR

Procedure	Illustration
3) Release the hook on the evaporator.	
4) Remove the one screw on the evaporator located at the fixed plate.	Evaporator
5) Pull out the evaporator.	

FAN MOTOR AND FAN

FAN MOTOR AND FAN

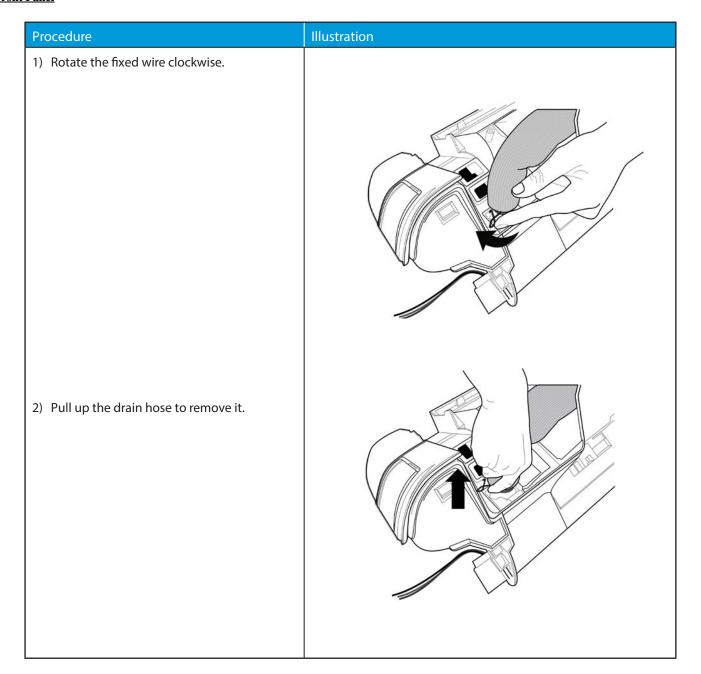

STEP MOTOR

Front Panel

NOTE: Remove the front panel and electrical parts before disassembling the step motor.

Procedure	Illustration
Remove the two screws, then remove the stepping motor.	Stepping Motor

DRAIN HOSE
